100 Days of Python

Day 43 — Practice Assignment: Nested Dictionaries

---

1. **Given employees = {"raj": {"dept": "Sales", "salary": 40000}, "priya": {"dept": "IT", "salary": 55000}}, print priya's department and raj's salary using nested key lookups.**

   Hint: employees["priya"]["dept"] reads left to right.

2. **Using the same employees dictionary, add a new employee "kiran" with dept "Sales" and salary 42000, then update raj's salary to 45000. Print the final dictionary.**

   Hint: a new outer key adds a record; employees["raj"]["salary"] = ... updates one field.

3. **Loop through the employees dictionary and print each name together with their department, in the format "raj works in Sales".**

   Hint: for name, info in employees.items():

4. **Print the total salary paid across all employees, then print the name of the highest-paid employee without sorting anything by hand.**

   Hint: add info["salary"] inside the loop for the total; use max() with a lambda key for the name.

5. **Given a nested dictionary of three books, each with a "price" and an "in_stock" count, print the total value of all books combined (price times in_stock, summed), then print the title of the book with the lowest stock.**

   Hint: this is the same pattern as the employees questions, just with different field names.
