

100 Days of Python

Day 8 — Practice Assignment: Comparison Operators in Python

1. Take two numbers, `a = 20` and `b = 35`. Print the result of checking if `a` is equal to, not equal to, greater than, and less than `b`, each on its own line.

2. You are building a simple ticket checker. A visitor's age is stored as `age = 15`. Check whether the age is greater than or equal to 18 and print the result as `True` or `False`.

3. Compare the string `"apple"` with `"Apple"` using `==` and print the result. Then explain in one line, using a comment, why the result came out that way.

Hint: Python comparisons are case-sensitive — `"a"` and `"A"` are not the same character.

4. You are building a simple travel planner. The budget available is `budget = 5000` and the trip cost is `trip_cost = 4800`. Check if the budget is greater than or equal to the trip cost, and print a message saying whether the trip is affordable.

Hint: Use `>=` to compare, and an `if` statement isn't needed yet — just print the `True/False` result in a readable sentence using an f-string.
