

100 Days of Python

Day 15 — Practice Assignment: Introduction to Loops & the for Loop

1. Using a for loop and range(), print numbers from 1 to 10, each on its own line.

2. Using a for loop, go through the list `fruits = ["apple", "banana", "mango", "grapes"]` and print each fruit along with its position, e.g. "1. apple".

Hint: Use `enumerate(fruits, start=1)` to get both the position and the fruit in one loop.

3. Using a for loop and range(), print all even numbers from 2 to 20.

Hint: `range()` takes a step value too — try `range(2, 21, 2)`.

4. You are building a simple travel planner. You have a list of cities to visit: `cities = ["Jaipur", "Udaipur", "Jodhpur"]`. Using a for loop, print a numbered day-wise plan, e.g. "Day 1: Visit Jaipur", "Day 2: Visit Udaipur", and so on. Also print the total number of cities in the trip after the loop ends.

Hint: Combine `enumerate(cities, start=1)` for the day numbers, and `len(cities)` for the total count.
