

100 Days of Python

Day 24 — Practice Assignment: String Slicing

1. Given phrase = "Automation", print the first 4 characters and the last 4 characters using slicing.

Hint: phrase[:4] grabs everything up to (but not including) index 4; phrase[-4:] grabs the last 4 characters.

2. Given text = "Data Science Rules", print every 3rd character starting from index 0, then print the string reversed.

Hint: text[:3] skips by 3, and text[::-1] walks backward through the whole string.

3. Given code = "TX-9981-QA", print the prefix before the first dash, the number between the dashes, and the suffix after the second dash, then combine them into a single formatted message using concatenation.

Hint: Slice out each piece separately (code[0:2], code[3:7], code[8:]) before joining them together with +.

4. Given long_text = "Python Slicing Made Easy", print the middle portion by skipping the first 7 characters and the last 5 characters, using a single slice.

Hint: You can slice with a negative stop, like long_text[7:-5], to trim from the front and the back at once.
