

100 Days of Python

Day 25 — Practice Assignment: String Methods

1. Given name = " jordan mills ", clean it up by stripping the extra whitespace and converting it to title case, then print the result.

Hint: Chain the methods together — `name.strip().title()` strips first, then capitalizes each word.

2. Given sentence = "the quick brown fox jumps", split it into a list of words, then join those words back together using a hyphen instead of a space.

Hint: `words = sentence.split()` breaks it apart on whitespace; `"-".join(words)` glues it back together.

3. Given review = "This product is bad, the packaging was bad too", replace every occurrence of "bad" with "great", then print the updated review.

Hint: `review.replace("bad", "great")` returns a new string with every match swapped — remember to store or print the result.

4. Given email = "contact@pyai.in", check whether it contains the "@" symbol using the `in` keyword, then use `.find()` to print the index where "@" appears.

Hint: "@" in email gives `True` or `False`; `email.find("@")` returns the starting index, or `-1` if it were missing.
