# 100 Days of Python

Day 52 — Practice Assignment: Lambda Functions

---

1. **Rewrite the function def double(n): return n * 2 as a lambda stored in a variable called double. Print double(8).**

   *Hint: lambda parameters: expression — no brackets and no return keyword.*

2. **Write a lambda called area that takes a length and a width and returns their product. Print area(4, 5).**

   *Hint: separate the two parameters with a comma, with no brackets around them.*

3. **Write a lambda called parity that returns "even" if a number is even and "odd" otherwise. Print the result for 4 and for 7.**

   *Hint: "even" if n % 2 == 0 else "odd"*

4. **Write a lambda called grade that takes marks and returns "pass" if the marks are 40 or above, and "fail" otherwise. Print the result for 55 and for 30.**

   *Hint: the value for the true case comes first, then if, the condition, else, and the other value.*

5. **A shop gives a 10% discount only on prices above 1000. Write a lambda called discount that returns the reduced price when it applies, and the original price otherwise. Print discount(2000) and discount(500).**

   *Hint: p * 0.9 if p > 1000 else p*
