

1. Given `point = (7, 3)`, print the whole tuple, its length, and the two values on separate lines using indexing.
2. Given `colors = ("red", "green", "blue", "yellow")`, print the first item, the last item, and the middle two items — using indexing and one slice.
3. Given `marks = (45, 67, 89, 34, 90)`, print the highest mark, the lowest mark, the total, and the average rounded to 2 decimal places.

*Hint: `max()`, `min()`, `sum()` and `len()` all work on tuples exactly as they do on lists.*

4. Given `t = (1, 2, 3)`, write a program that prints a new tuple where the first item is 99, then prints `t` again to prove the original is unchanged.

*Hint: a tuple cannot be edited in place. Build a new one from pieces: `(99,) + t[1:]`.*

5. Given `records = [("Asha", 88), ("Ravi", 92), ("Meera", 79)]`, loop through the list and print each name with its marks, then print the name of the highest scorer.

*Hint: for `name, mark` in `records`: unpacks each tuple automatically. Track the best name and mark as you loop.*
