

1. Given `team_a = ["Ravi", "Meera"]` and `team_b = ["Zoe", "Kabir"]`, combine them into a new list called `all_players` using `+` and print it, then print `team_a` to show it was not changed.
2. Given a base pattern of stars `["*"]`, use `*` to build a list that repeats it 6 times, and print the result.
3. Given `cart = ["milk", "eggs", "bread"]`, check whether "butter" is in the cart using `in`, and print a message saying whether it needs to be added.
4. Given `temps = [72, 68, 75, 71, 69]`, find the highest, lowest, and average temperature using `min()`, `max()`, and `sum()`, then print all three values in a single formatted sentence.

*Hint: Use `min(temps)` and `max(temps)` directly, and compute the average as `sum(temps) / len(temps)` before combining all three into one string with `.format()` or an f-string.*
