

100 Days of Python

Day 35 — Practice Assignment: List Challenges (Mixed Review)

1. Given `playlist = ["jazz", "rock"]`, append "pop" to the end, then insert "lofi" at index 0. Print the final list.

2. Given `cart = ["pen", "book", "eraser", "book"]`, remove the first occurrence of "book", then pop the last item from what remains. Print the popped value and the final list.

3. Given `marks = [55, 91, 68, 73, 40]`, sort the list in ascending order with `.sort()`, print it, then reverse it in place with `.reverse()` and print it again.

4. Given `team_a = ["Ravi", "Zoe"]` and `team_b = ["Kim", "Sam"]`, combine them into a single list called `everyone` using `.extend()` so the members appear individually (not as a nested list). Print `everyone`.

Hint: Use `team_a.extend(team_b)`, don't use `.append()` here.

5. Given `visits = ["home", "shop", "home", "gym", "home", "shop"]`, find how many times "home" appears and the index of its first occurrence, then print a single sentence combining both results, like "home appears 3 times, first at index 0".

Hint: Use `visits.count("home")` and `visits.index("home")`, then drop them into an f-string.

6. Given `stock = [12, 45, 45, 8, 19, 45, 3]`, write code that: (a) counts how many times the most frequent-looking value 45 appears, (b) removes just one occurrence of 45, (c) inserts the number 100 at index 2, and (d) finally sorts the whole list in descending order. Print the list after each step.

Hint: Chain the methods in order: `count()` -> `remove()` -> `insert()` -> `sort(reverse=True)`.
