

100 Days of Python

Day 13 — Practice Assignment: Nested if Statements in Python

1. Take `age = 20` and `has_id = True`. First check if age is 18 or above. If true, then inside that block, check if `has_id` is True and print "Entry allowed". If the person has no ID, print "ID required".

2. You are building a simple movie ticket checker. Take `age = 16` and `has_parent = False`. First check if age is below 18. If true, then inside that block, check if `has_parent` is True to print "Ticket allowed with parent", otherwise print "Ticket not allowed". If age is 18 or above, print "Ticket allowed".

Hint: The outer if-else splits by age; the inner if-else (nested inside the "below 18" branch) then checks `has_parent`.

3. Take `num = 12`. First check if the number is positive. If true, then inside that block, check if the number is even or odd and print the appropriate message (e.g. "Positive and Even"). If the number is not positive, print "Not a positive number".

4. You are building a simple travel planner. Take `budget = 18000` and `destination = "international"`. First check if the budget is above 15000. If true, then inside that block, check the destination: if it is "international" print "You can book an international trip!", otherwise print "You can book a domestic trip!". If the budget is 15000 or below, print "Increase your budget to plan a trip".

Hint: Keep the destination check indented one level deeper than the budget check, so Python knows it only runs when the budget condition is already True.
