

100 Days of Python

Day 14 — Project 02: Age Eligibility System

Project Brief

Build a program that takes a person's age as input and tells them which activities they are eligible for — combining everything you've learned so far: input/output, comparison operators, logical operators, and if / elif / else / nested if statements.

Requirements

- 1 Ask the user to enter their age using `input()`, and convert it to an integer.
- 2 If the age is below 0, print "Invalid age entered" and stop — don't check anything else.
- 3 If the age is between 0 and 4 (inclusive), print "Not eligible for school yet".
- 4 If the age is between 5 and 17, print "Eligible for school", and inside that same check, also print "Eligible for a movie ticket with a parent".
- 5 If the age is between 18 and 64 (inclusive), print "Eligible for voting", "Eligible for a driving licence", and "Eligible to watch any movie".
- 6 If the age is 65 or above, print "Eligible for senior citizen benefits", along with all the eligibilities from the adult category above.
- 7 For every valid age (0 or above), also print the person's eligibility for a driving licence separately using a comparison operator (`age >= 18`), regardless of which category they fell into.

Hint: Use if-elif-else for the main age categories, and a nested if inside the "5 to 17" branch for the extra movie-ticket message. Handle the invalid age check first, before any other condition.

Bonus Challenge

Also ask the user whether they have a valid ID (yes/no using `input()`). If they are between 13 and 17 and do NOT have an ID, print an extra message: "Please carry an ID proof for age verification".
