

100 Days of Python

Day 18 — Practice Assignment: The break Statement in Python

1. Using a for loop with range(1, 11), print numbers from 1 onward, but stop the loop completely as soon as you reach 6 using break.

2. Using a for loop, go through the list numbers = [4, 12, 7, 19, 3, 25, 9] and stop the loop as soon as you find a number greater than 15, printing that number before breaking.

Hint: Put an if condition inside the loop to check the value, and call break right after printing it.

3. Using a while loop, keep asking the user to enter a number. Break out of the loop as soon as they enter a negative number, and print "Loop stopped" after the loop ends.

4. You are building a simple travel planner. You have a list of cities with their entry fees: fees = [200, 150, 500, 100, 300]. Your total budget is 700. Using a for loop, keep adding each city's fee to a running total, printing how much you've spent so far. As soon as adding the next city's fee would cross the budget, break out of the loop and print "Budget limit reached, stopping trip planning".

Hint: Check the condition before adding the fee to your running total, e.g. if total + fee > 700: break.
