

1. Given price = 8.5, use an f-string to print "Total: \$8.50", rounding to exactly 2 decimal places.
2. Given name = "Riya" and rank = 2, use an f-string to print "Riya finished in position 2".
3. Given code = 5, use a format spec inside an f-string to print it zero-padded to 4 digits, so it prints as "0005".
4. Given rate = 0.6345, use an f-string to print it as a percentage rounded to 2 decimal places, then on a separate line use an f-string to print the word "Rate" right-aligned within a 10-character width followed by a "|".

Hint: `f'{rate:.2%}'` handles the percentage; `f'{"Rate":>10}|'` handles the right-aligned padding.
