

100 Days of Python

Day 5 — Practice Assignment: Type Conversion in Python

1. Convert the string "25" into an integer and the string "3.9" into a float, then print both values along with their types.
2. Take the integer `x = 100` and convert it into a string, then print a sentence like "The value is 100" by joining it with another string using `+`.
3. Take the float `price = 499.95` and convert it into an integer. Print the result and explain in one line, using a comment, what happened to the decimal part.

Hint: `int()` on a float truncates — it does not round.

4. You are building a simple travel planner. The number of travel days is stored as text, `days = "5"`, and the daily budget is stored as text, `budget = "1500"`. Convert both to integers, then calculate and print the total trip cost.

Hint: Convert both variables to `int()` first, then multiply them together.
