

100 Days of Python

Day 17 — Practice Assignment: The range() Function in Python

1. Using range() in a for loop, print numbers from 0 to 9.
2. Using range() in a for loop, print numbers from 10 to 1 in descending order.
Hint: range() can take a negative step, e.g. range(10, 0, -1).
3. Using range() in a for loop, print all multiples of 3 between 3 and 30.
4. You are building a simple travel planner. A trip is planned for 7 days, starting from day 1. Using range() in a for loop, print "Day 1", "Day 2" ... up to "Day 7", and on every 3rd day, also print "Rest day - no travel planned" right after the day number.

Hint: Loop with for day in range(1, 8), and inside the loop use if day % 3 == 0 to catch every 3rd day.
